Tier 5 | Production on AWS

Modules 19-21 | SDK 1.62 | 2026-10-29

Release gate

Evaluate task accuracy, grounded citations, denied actions and failure paths before deployment. A passing mock suite proves contracts, not live-model quality.

Observability

Use traces/spans for timing and metrics for aggregate behavior. Keep prompts, credentials and PII out of exported telemetry. Set retention and inspect exports.

Choose hosting

Local: fastest iteration. Lambda: bounded short calls. Fargate: container control with ongoing costs. AgentCore Runtime: managed agent hosting and sessions.

AgentCore map

Runtime hosts; Memory stores events/records; Gateway exposes tools; Identity validates access; Policy enforces tool rules; Evaluations measures behavior.

Verify locally first

```
uv sync --all-groups
npm ci --prefix infra
uv run --all-groups python scripts/synth_all.py
```

Before deployment

Review the synthesized IAM and resources. Confirm model/profile/region, SSO, budget and deployment account. Build the correct container platform. Never deploy by smoke test.

Teardown sequence

Stop schedules and active sessions; detach external policy attachments; delete app stacks; clean retained logs/assets as documented; inspect tagged leftovers in each used region.

Checkpoint

Present evaluation evidence, scoped IAM, a resource/cost inventory and teardown commands. Record live AWS, Docker and onboarding checks separately from local passes.
